

CraigMaps

CS5610 Web Development Project Report

Individual project by: Rathi Sowumya Thirunavukkarasu

NUID: 001664425

Problem statement

To search for rentals, we use Craigslist and then to check if the place is closeby our work/school address, we search the google maps to check on the distance and time taken to travel from the rental listing's address.

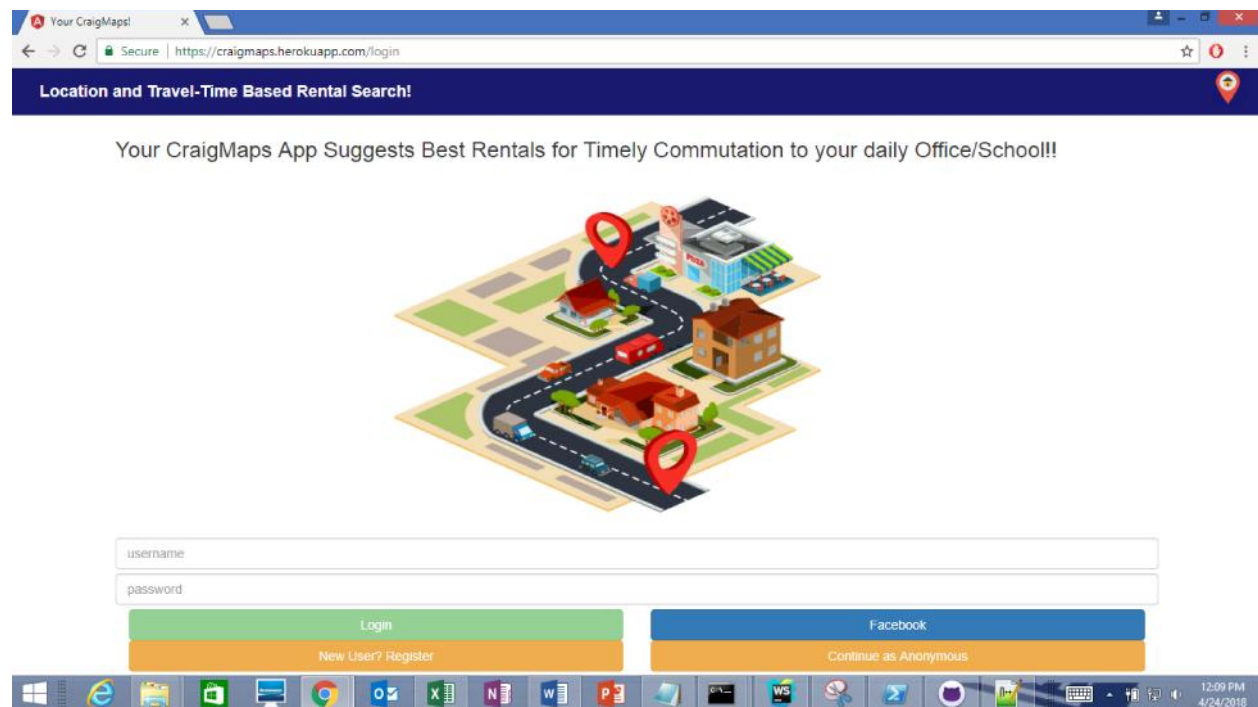

It would be nice to have one search that recommends the rentals based on time taken to travel to the office, instead of, the user had to calculate the distance and then have to compare for the reasonable rent closer to the destination. **Thanks to Professor Ming** for this entire idea! :)

Proposed Solution

My project is presenting an app which suggests the rentals based on your time for travel. Hence the name **Craigslist + Google maps = CraigMaps!** It is a Location and Travel-Time Based Search!

My Project CraigMaps

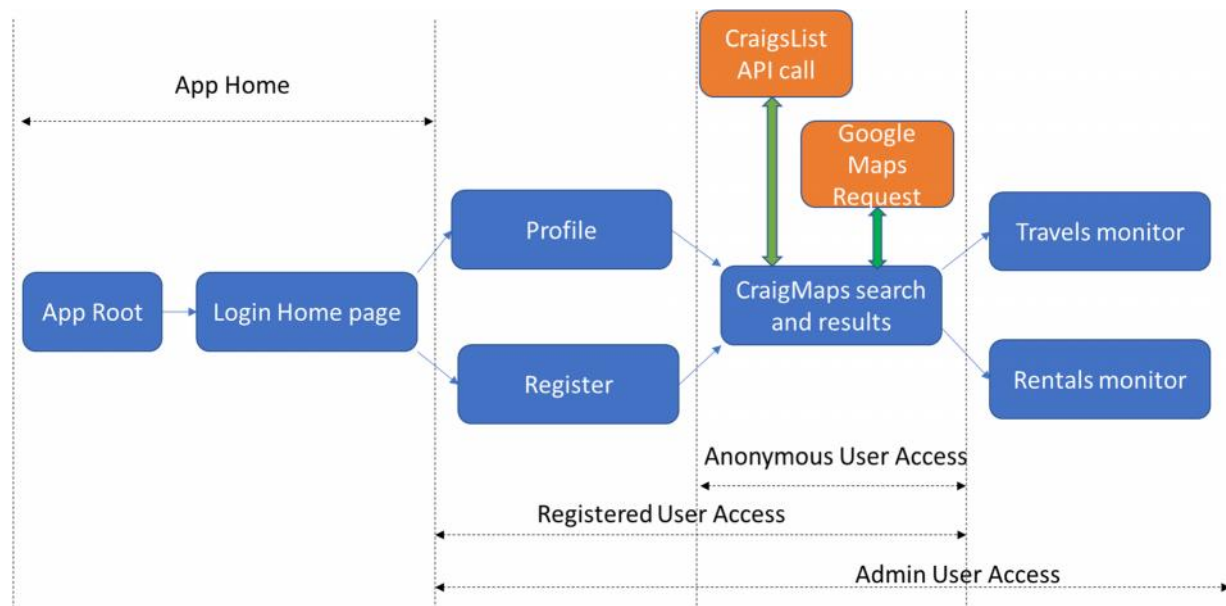

- Heroku Link: <https://craigmaps.herokuapp.com/login> [Project's Home Page]
<https://craigmaps.herokuapp.com/> [Both project and assignment route]
- Github repository: <https://git.heroku.com/craigmaps.git>
Release: 1.0 , Tag: "CraigMaps v1.0 Rathi WebDev Project"

Design

Web Components, External API and Users interactions

Here is the flow and component interactions:

Features of App

- Made use of **2 External API** calls:
 - ✓ **Craigslist** [for Rental]
 - ✓ **Google Maps** [for Routes from rental to Destination]
- Results are shown **sorted** by the time taken to travel to destination.
- Results are shown in **tabular format** which also **includes the craigslist URL for each listing**.
- Results render a **chart** analyzed on location of rental in relevance to distance and time of travel to destination.
- All users have access to **search results** including **anonymous user** where they can search and view results.
- **Admin users** alone get to monitor app results for rentals and travels.
- Each webpage has access back to home page and to profile for logout.
- **Facebook login** feature.
- **Secured login and logout** for registered users.

Classes, Objects and Variables

User is the class used and it has a field 'admin' to determine if the user has special privileges of monitoring the app.

The search takes in values of **City for rental** and **budget range** of less than \$5000(Default). \$5000 to \$10000 and \$10000 to \$15000.

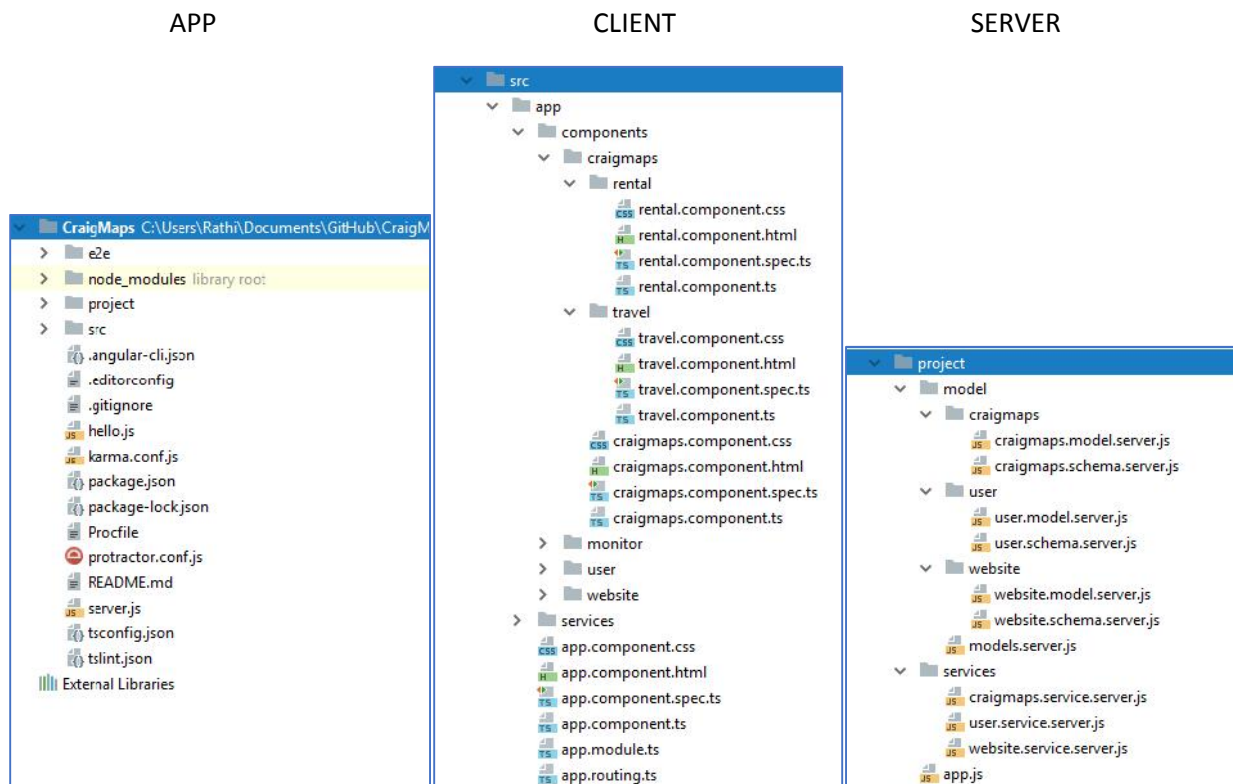

It asks for Destination **address/city the user commutes to** along with **mode of transport** which is similar to Google Maps mode as DRIVING(Default value), WALKING, BICYCLING and TRANSIT.

Implementation

Algorithm

- 1) Fetch all the rentals of the city with budget constraints through Craigslist 'search()' method.
 - a. For each rental got from craigslist, calculate the time taken to travel using the Google Maps 'route()' method/request call.
 - b. Combine the rental info with the travel distance and duration info for each record
- 2) Return results
- 3) Render as tables and charts

Folder structure and file organization

Results

- ➔ Results of the specified rent range are shown in table which are Sorted by Rent and time to destination and analysis of chart is shown
- ➔ Could see that the more distance, less price and the more time, less rent for Seattle downtown areas! Which is pretty much the case that living nearby the downtown area is expensive!

Charts:

x:rent vs y:time(in seconds) to reach

x:rent vs y distance(in meters) to reach

Table:

House Location	Rent	Time to reach	Distance	Craigslist on Details
SLUDenny Triangle Cap Hill	\$5250			https://seattle.craigslist.org/see/apal/d/new-beautiful-2-bed-2-bath/6569433464.html
Bothell	\$5209	20 mins	8.7 mi	https://seattle.craigslist.org/sno/apal/d/extended-patio-with-wetland/6569619433.html
UDistrictUniversity District	\$5600	22 mins	14.4 mi	https://seattle.craigslist.org/see/apal/d/7-bedrooms-3-bath-udistrict/6559461236.html
Medina	\$6456			https://seattle.craigslist.org/see/apal/d/house-golf-course-view-for/6569510277.html
Bellevue	\$5454	16 mins	8.0 mi	https://seattle.craigslist.org/est/apal/d/come-see-your-new-view-of-the/6569336381.html
Washington ParkMadison Park	\$6500	22 mins	13.7 mi	https://seattle.craigslist.org/see/apal/d/prime-washington-park-view/6569632142.html
DowntownPioneer Square	\$5974	27 mins	16.2 mi	https://seattle.craigslist.org/see/apal/d/only-penthouse-in-seattle-you/6551175726.html

Implementation Notes

The craigslist search is constrained to a total of by about 50 records as the Google Maps request allowed per day is about 5000 for free Google API access. This can be relaxed in future to render any number of results.

Testing (Functional Testing with DETAILED steps)

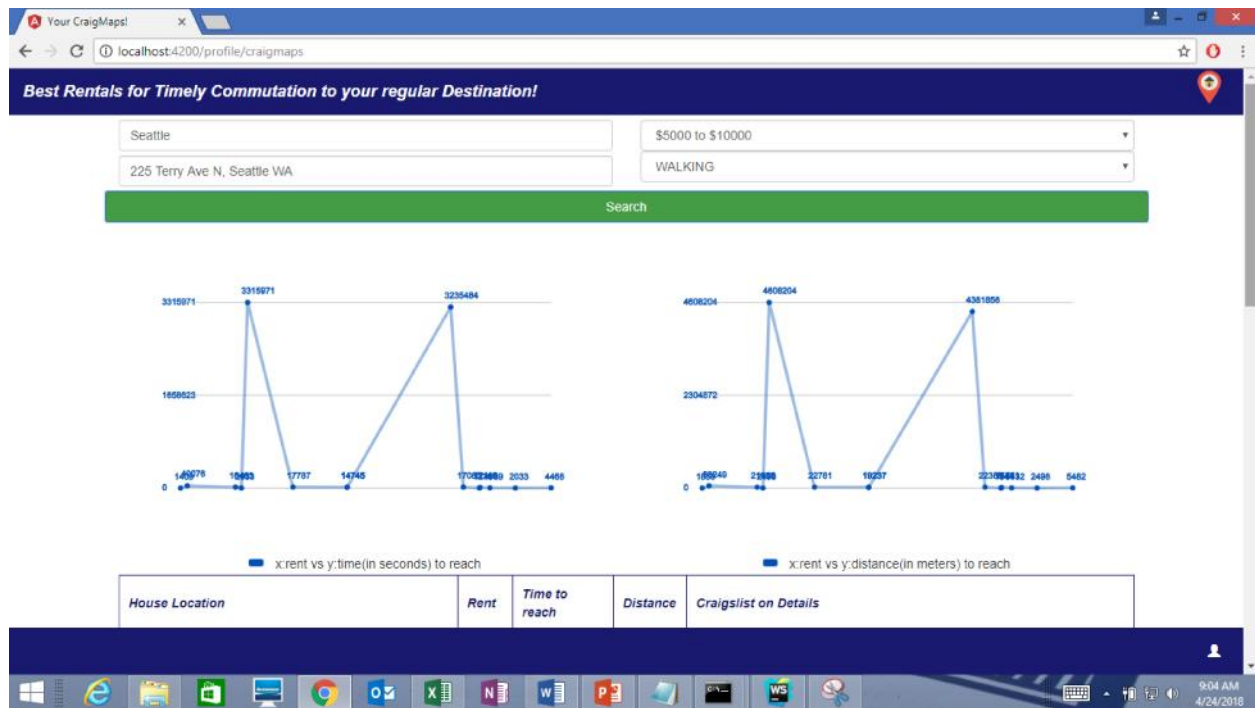

Testing Notes

1. Have already created users:
 - a. admin/admin -> with admin role
 - b. dan/dan -> registered user
2. Please give only the one-word city name for 'City' input field
3. Results are restricted for few rows as Google maps only few requests per day for free API subscriptions
4. Sample inputs:
 - a. City: Seattle
 - b. Address to commute to: 225 Terry Ave N, Seattle, WA
 - c. Rent: \$5000 - \$10000
 - d. Mode: DRIVING

Tests Done

1) Successful App Main Objective functionality for Registered user (dan/dan)

- ➔ Results of the specified rent range are shown in table which are Sorted by time to destination and analysis chart is shown
- ➔ Could see that the more distance, less price and the more time, less rent for Seattle downtown areas! Which is pretty much the case that living nearby the downtown area is expensive!

9:04 AM 4/24/2018

2) Opens craigslist for details in separate window

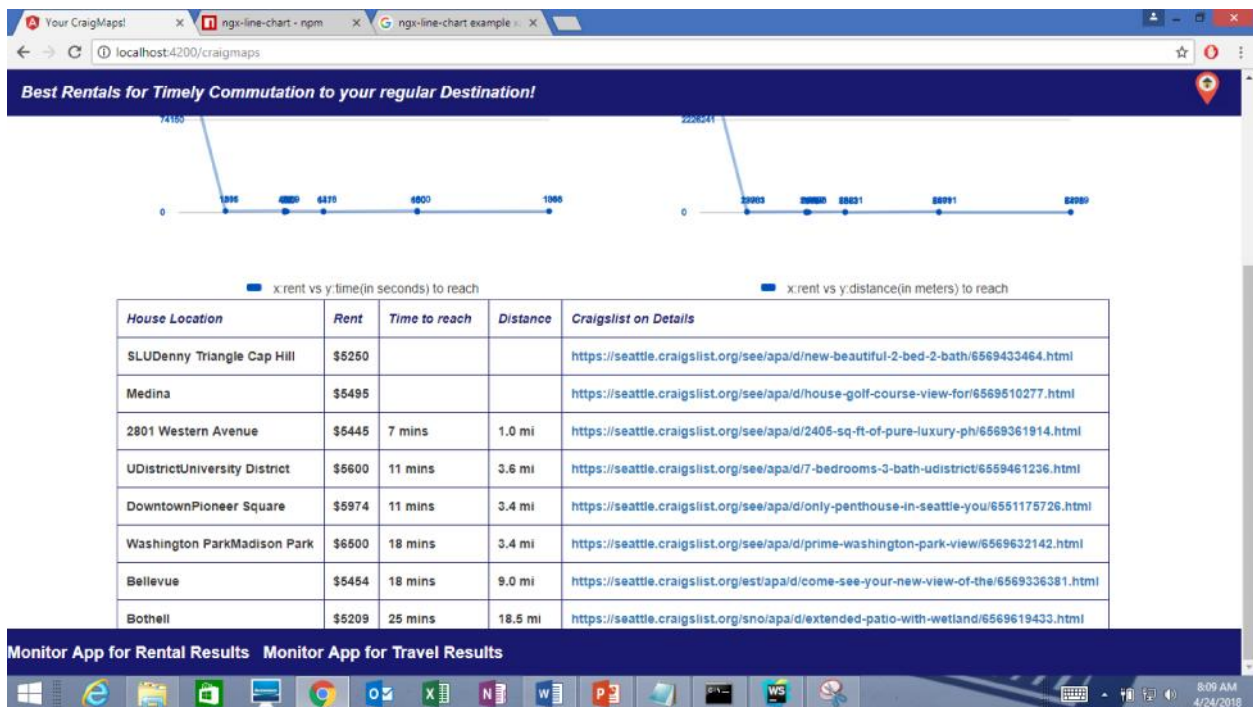

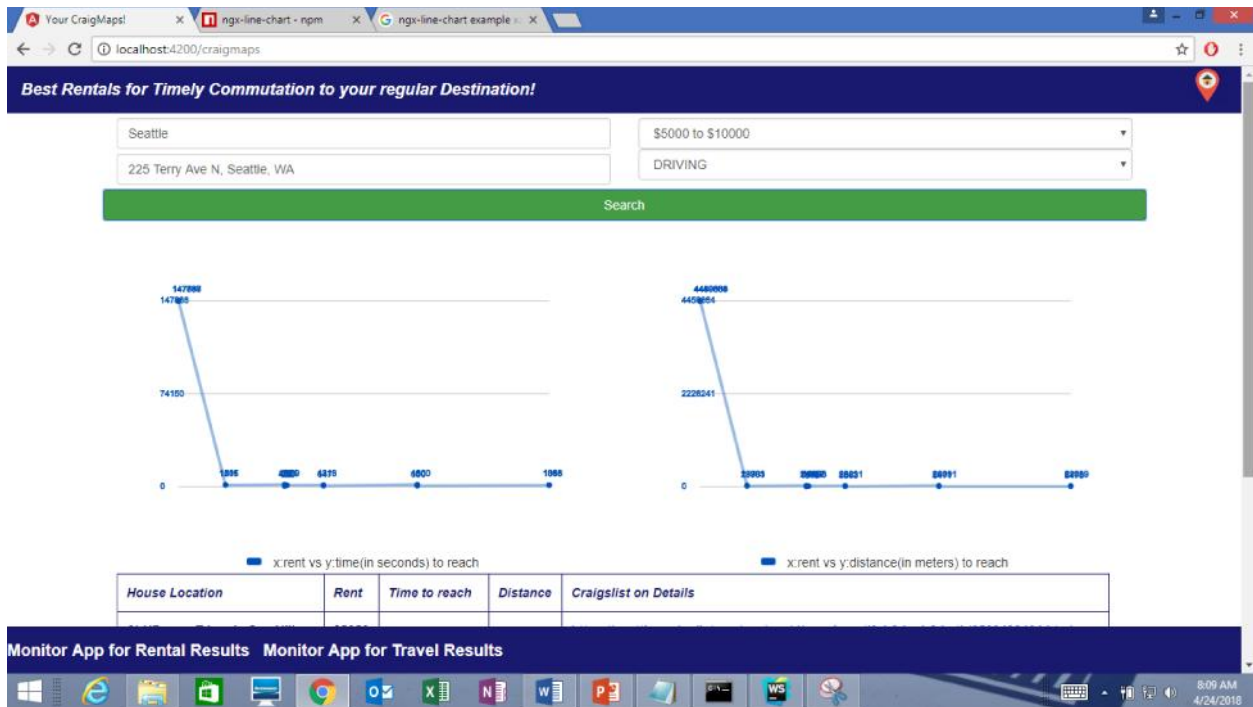

3) Registered user cannot monitor but can access profile

→ Successfully shows only the user icon access to profile but not monitor links

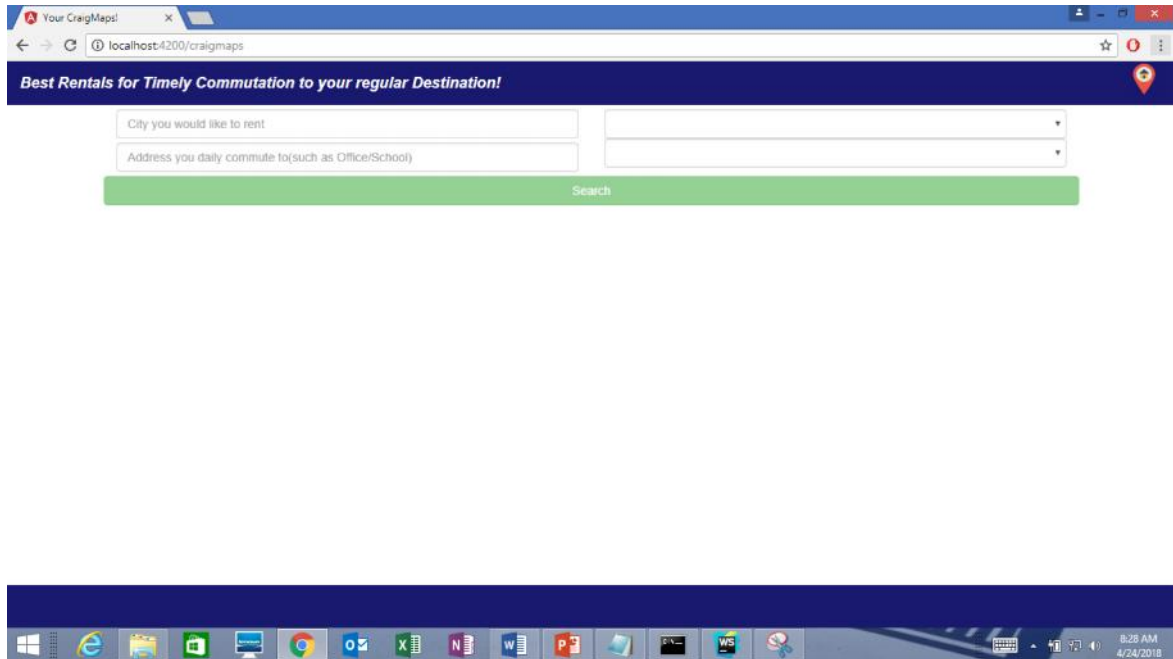

4) Successful App Main Objective functionality for Anonymous user

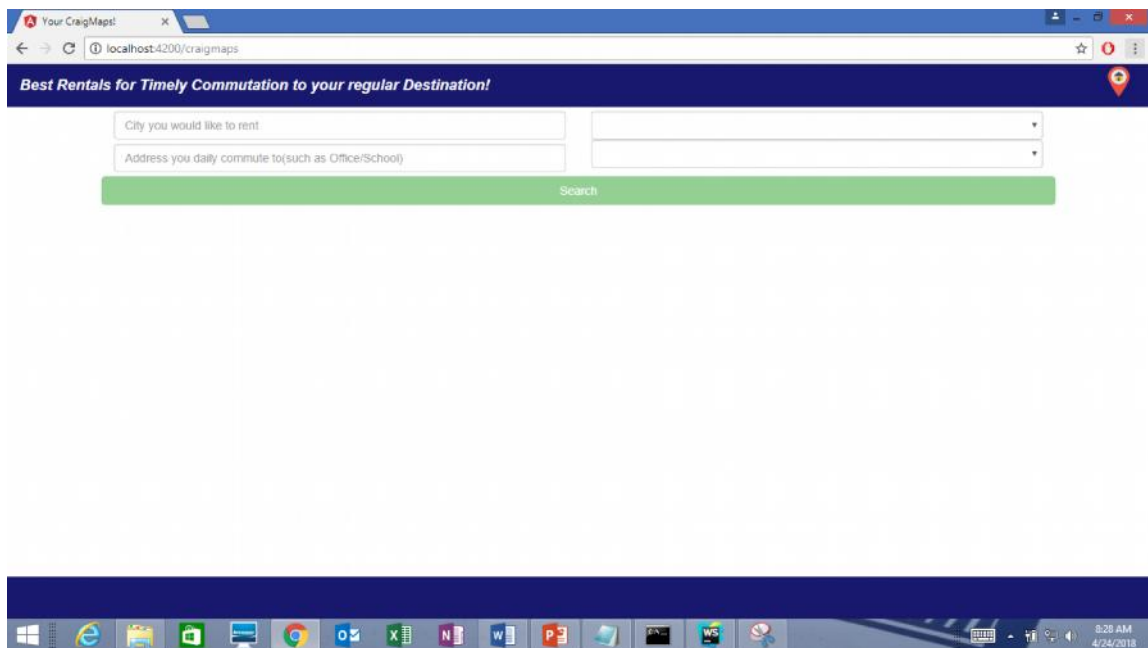

5) Anonymous has no profile access

→ Successfully, does not show the user icon in the bottom bar for anonymous

6) Anonymous cannot monitor

→ Successfully, does not show the monitor links in the bottom bar for anonymous

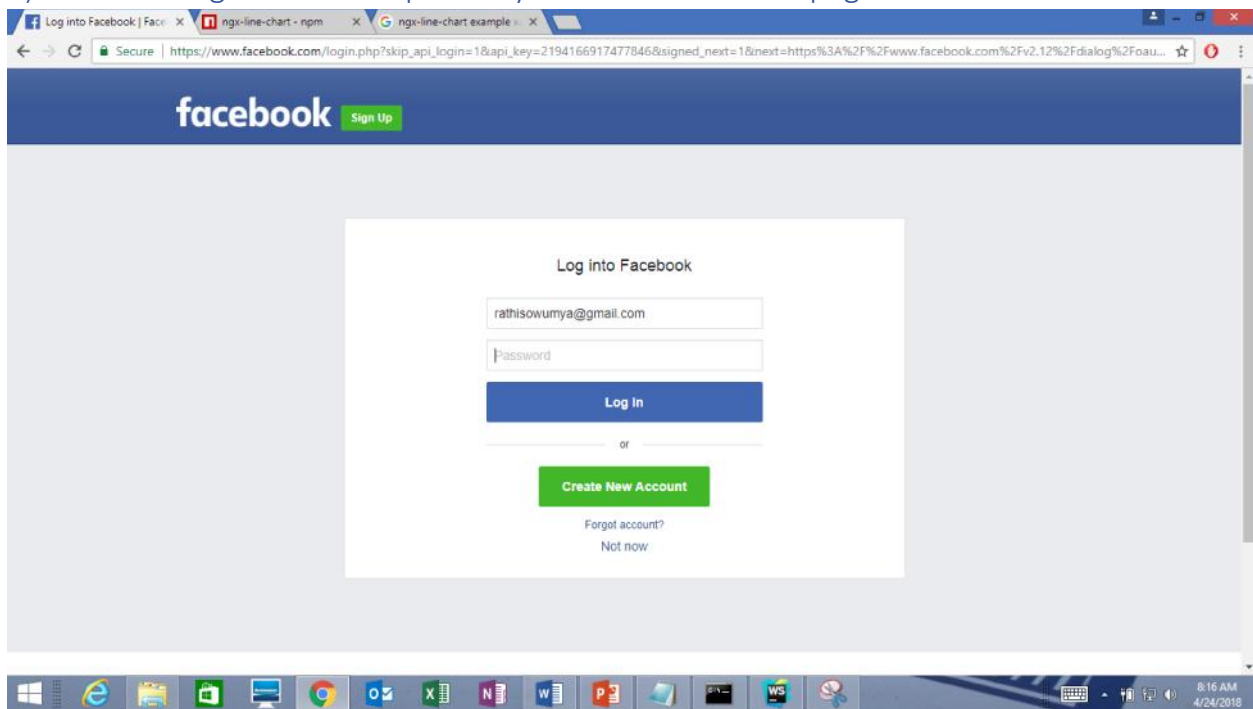

7) Logo click takes to homepage in every page perfectly

The screenshot shows a web application interface. At the top, there is a dark blue header bar with the text "Monitor Travel results!" on the left. On the right side of this header, there is a small circular logo containing a red location pin icon, which is circled in red. Below the header, there are two input fields: the first is labeled "City/Address" and the second is labeled "Address you daily commute to (such as Office/School)". Below these fields is a green button labeled "Search".

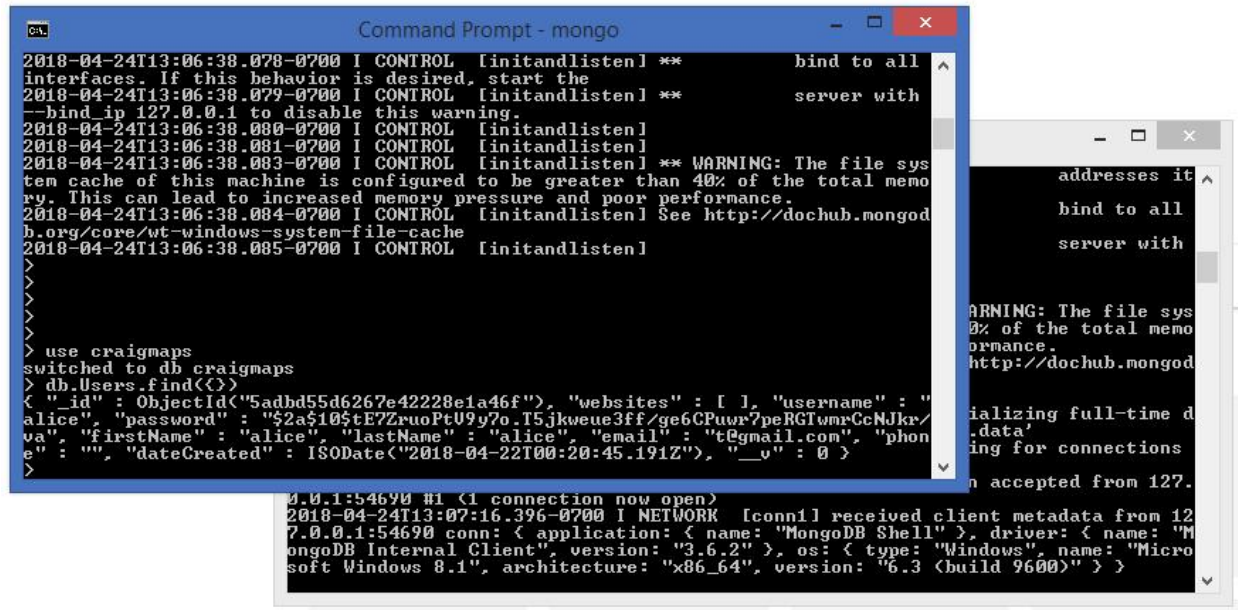

8) Facebook login allowed is perfectly allowed from homepage

The screenshot shows the Facebook login page. The browser's address bar displays the URL "https://www.facebook.com/login.php?skip_api_login=1&api_key=2194166917477846&signed_next=1&next=https%3A%2F%2Fwww.facebook.com%2Fv2.12%2Fdialog%2Foau...". The Facebook logo and a "Sign Up" button are at the top. The main content area features a "Log into Facebook" section with two input fields: "Email or phone" (containing "rathisowumya@gmail.com") and "Password". Below these fields is a blue "Log In" button. Underneath the "Log In" button is the text "or" and a green "Create New Account" button. At the bottom of the login section are the links "Forgot account?" and "Not now?". The Windows taskbar is visible at the bottom of the screen, showing various application icons and the system clock indicating 8:16 AM on 4/24/2018.

9) CRUD for user -> Register, Update, Delete new user

→ CRUD operations for user is successful through profile and register components

10) Admin can monitor

→ Successfully shows user icon along with monitor links

→ Also, the monitor pages are accessible for both rental and travel

Conclusion

App in Heroku

The App is successfully hosted in Heroku <https://craigmaps.herokuapp.com/login> and can be accessed for usage.

Future Improvements

If many users are using this app, then Google API subscription can be taken, to make any number of requests to Google API for route calculations.

Send suggestions for registered users for seasonal rentals.

Other rental search attributes like 'nearby' can be added for results.

Conclusion Thoughts

Doing this project was real fun! Thanks to **Professor Ming** for this idea and to TA **Hunter** for the support.
